Notes

<sup>1</sup> Grain number and spot designation refers to SIMS U-Pb analyses documented in Table S1 (with the exception of Lew99-Ky analysis Hf-1 for which no complementary SIMS analysis was performed). Where accompanied by text in parentheses, the latter indicates grain numbers assigned during concurrent Pb and Hf-Lu-Yb isotope measurements.

<sup>2</sup> All ratios are quoted at 2 $\sigma$  precision.

<sup>3</sup> Age calculated from <sup>207</sup>Pb/<sup>206</sup>Pb ratios determined concurrently with Hf-Lu-Yb isotope measurements.

<sup>4</sup> Age calculated using either preferred/minimum assigned age for grains based on evaluation of SIMS and, where undertaken, LA-ICPMS analyses (see text for criteria).

<sup>5</sup> Initial <sup>176</sup>Hf/<sup>177</sup>Hf and  $\epsilon_{\text{Hf}}$  values were calculated using the preferred/minimum crystallisation ages (see text), the <sup>176</sup>Lu decay constant of Scherer et al. (2001) and the chondrite values of Blichert-Toft and Albarède (1997). Errors in  $\epsilon_{\text{Hf}}$  were derived from the 2 $\sigma$  uncertainty for initial <sup>176</sup>Hf/<sup>177</sup>Hf, which itself incorporates uncertainty in the crystallisation age, the <sup>176</sup>Lu decay constant and in the measured <sup>176</sup>Hf/<sup>177</sup>Hf and <sup>176</sup>Lu/<sup>177</sup>Hf.

<sup>6</sup> Simplified description of analysed volume differs slightly from Table S1 due to larger sampling volume of LA-ICPMS analyses.
