

Appendix E: Diagrams illustrating the major-element composition of (a,b) phengite and (b,c) biotite in the studied samples. The composition of phengite varies along the celadonite substitution vector ($X_{+1}Al_2Si_{+1}$). The Mg# and the content of tetrahedrally-coordinated Al (Al^{IV}) vary independently. Superscripts denote: *less paramagnetic magnetic fraction, †paramagnetic fraction, ‡brown biotite, §green biotite.
